## LIFE DESIROWS (LIFE19 ENV/ES/00447)

develops an industrial process of circular economy of zero liquid discharge, giving use to salts and maximizing the reuse of water for irrigation from both urban and groundwater purification.

The entire industrial process combines various technologies based on renewable energies, specifically, photovoltaic solar energy and biomass.

The project funded by the LIFE Program of the European Union will also make it possible to reuse these salts, which contain a large amount of nutrients, as agricultural fertilizer, as well as for other industrial uses.

## **LIFE DESIROWS BENEFITS**

An advantage over the production of desalinated sea water, since it is achieved at the same price, but without the generation of waste.

An improvement in the quality of reclaimed water for the agricultural sector from underground wells at an affordable price.

The use of technologies based on renewable energy sources.
